1. Suspected dyspepsia
   Predominant (> 1 month):
   • Epigastric discomfort/pain
   • Upper abdominal distension or bloating
   No

2. Is it GERD?
   Predominant symptoms of heartburn +/- regurgitation
   Yes
   Follow GERD pathway
   No

3. Alarm features
   • Family history (first-degree relative) of esophageal or gastric cancer
   • Personal history of peptic ulcer disease
   • Age > 60 with new and persistent symptoms (> 3 months)
   • Unintended weight loss (> 5% over 6-12 months)
   • Progressive dysphagia
   • Persistent vomiting (not associated with cannabis use)
   • Black stool or blood in vomit (see Primer on Black Stool)
   • Iron deficiency anemia (see Iron Primer)
   No

4. Medication and lifestyle review
   • Medication history, including OTCs and supplements
   • Dietary triggers, alcohol, weight management, stress, caffeine, smoking
   Symptoms improve
   No further action required
   Other diagnosis

5. Baseline investigations
   • CBC, INR, BUN
   • Ferritin
   • Celiac disease screen
   • Abdominal ultrasound, ALT, ALP, bilirubin, lipase (if considering hepatobiliary or pancreatic disease)
   Other diagnosis

6. Test and treat for H. pylori infection (HpSAT or UBT)
   Positive
   Follow H. pylori pathway
   Negative
   Other diagnosis

7. Pharmacological therapy
   PPI trial: Once daily for 4-8 weeks
   Symptoms resolve
   Discontinue or titrate down to lowest effective dose
   Inadequate response
   Optimize PPI: Twice daily for 4-8 weeks
   Inadequate response
   Consider investigations not completed in 5 and 6
   No significant findings
   Optional or while awaiting specialist consultation:
   • Low-dose tri-cyclic antidepressant trial (TCAs) (weak evidence)
   • Domperidone trial (weak evidence) (if patient is age < 60, QT interval is normal, no family history of sudden cardiac death) start 5mg TID, increase to 10mg TID max
   Other diagnosis
   PPI maintenance
   • Lowest effective dose
   • Consider annual trial of deprescribing

8. Refer for consultation/endoscopy
   If unsatisfactory response, consider using an advice service before referring

Initial investigation and management (dependent on history)
This primary care pathway was co-developed by primary and specialty care and includes input from multidisciplinary teams. It is intended to be used in conjunction with specialty advice services, when required, to support care within the medical home. Wide adoption of primary care pathways can facilitate timely, evidence-based support to physicians and their teams who care for patients with common low-risk GI conditions and improve appropriate access to specialty care, when needed. To learn more about primary care pathways, check out this short video.

**DYSPEPSIA PATHWAY PRIMER**

- Although the causes of dyspepsia include esophagitis, peptic ulcer disease, *Helicobacter pylori* (*H. pylori*) infection, celiac disease, and rarely neoplasia, most patients with dyspepsia have no organic disease with a normal battery of investigations, including endoscopy. Dyspeptic symptoms in the general population are common. Estimates are that as high as 30% of individuals experience dyspeptic symptoms, while few seek medical care.
- The mechanism of this symptom complex isn’t completely understood, but likely involves a combination of visceral hypersensitivity, alterations in gastric accommodation and emptying, and altered central pain processing.
- Differential diagnosis
  - There is frequent overlap between dyspepsia and gastroesophageal reflux disease (GERD). If the patient has predominant heartburn symptoms, refer to the GERD pathway.
  - Dyspepsia also overlaps with irritable bowel syndrome (IBS), especially if upper abdominal bloating is a dominant symptom. In IBS, the predominant symptom complex includes bloating and relief after defecation.
  - **Biliary tract pain** should also be considered, with classic presentation being a post-prandial deep-seated crescendo-decrescendo right upper quadrant pain (particularly after a fatty meal) that builds over several hours and then dissipates. Often, it radiates to the right side towards the right scapula and may be associated with nausea and vomiting.

**EXPANDED DETAILS**

1. **Suspected dyspepsia**
   - Dyspepsia is characterized by epigastric pain or upper abdominal discomfort. It may be accompanied by a sense of abdominal distension or “bloating,” early satiety, belching, nausea, and/or loss of appetite.
   - The Rome IV committee on functional GI disorders defines dyspepsia as one or more of the following symptoms for three months prior, with symptom onset ≥ six months prior:
     - Postprandial fullness
     - Epigastric pain
2. **Is it GERD?**
   - If the patient's predominant symptom is heartburn ± regurgitation, refer to the GERD pathway.

3. **Alarm features**
   If any of the following alarm features are identified, refer for consultation/endoscopy. Include any and all identified alarm features in the referral to ensure appropriate triage.
   - Family history (first-degree relative) of esophageal or gastric cancer
   - Personal history of peptic ulcer disease
   - Age > 60 with new and persistent symptoms (> 3 months)
   - Unintended weight loss (> 5% over 6-12 months)
   - Progressive dysphagia
   - Persistent vomiting (not associated with cannabis use)
   - Black stool or blood in vomit (see Primer on Black Stool)
   - Iron deficiency anemia (see Iron Primer)

   **Note:** FIT testing is not required or suggested. It has only been validated for screening in asymptomatic individuals.

   Stronger consideration should be given for symptoms that are > 3 months in duration and have failed a trial of PPI. Evidence suggests that alarm features poorly predict clinically significant pathology and should be factored into the entire patient presentation, not in isolation.

4. **Medication and lifestyle review**
   - **Medication review**
     - Common culprits include ASA/NSAIDs/COX-2 inhibitors, corticosteroids, bisphosphonates, antibiotics, dabigatran, metformin, and iron or magnesium supplements.
     - Any new or recently prescribed or over the counter medications or herbal/natural products may be implicated, as virtually all medications can cause GI upset in some patients.
   - **Lifestyle review**
     - Review and address lifestyle factors that may contribute to symptoms, including obvious dietary triggers, alcohol intake, weight management, stress, caffeine intake, and smoking. Use the Gut Health Patient Journal as a resource for patients to track symptoms, diet, and lifestyle factors.
     - Engage other health professionals, as appropriate (nurse, dietitian, pharmacist, etc.).
     - Heavy cannabis use can be associated with persistent vomiting/other GI symptoms and should be considered and addressed, if appropriate.

5. **Baseline investigations**
   - Baseline investigations to identify concerning features or clear etiologies include CBC, INR, BUN (blood urea nitrogen), ferritin, and celiac disease screen.
   - Upper GI series is not recommended for investigation of dyspepsia due to high rates of false positives and false negatives.
   - If hepatobiliary or pancreatic disease is suspected, consider abdominal ultrasound, ALT, ALP, bilirubin, and lipase (lipase ≥ 3 times upper normal limit may be indicative of acute pancreatic disease).

---

1 There is some variation between guidelines about the age at which dyspepsia symptoms are more concerning and warrant stronger consideration of gastroscopy. Choosing Wisely Canada now uses age 65. However, age is only one element of a risk assessment related to the need for gastroscopy to investigate dyspepsia symptoms.
Pancreatic cancer should be considered in patients with dyspepsia and weight loss, especially if there is evidence of jaundice. The investigation of choice for suspected pancreatic cancer is an urgent CT scan.

6. **Test and treat for *H. pylori* Infection**
   - See [H. pylori pathway](#).

7. **Pharmacological therapy**

<table>
<thead>
<tr>
<th>Treatment options (pharmacological)</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Proton pump inhibitors (PPIs)</strong></td>
</tr>
</tbody>
</table>
| - **Evidence:** In the absence of *H. pylori* infection, or if symptoms continue despite *H. pylori* eradication, a trial of PPI may benefit some patients.
| - **Mechanism of action:** Suppresses gastric acid secretion by inhibiting the parietal cell H⁺/K⁺ ATP pump.
| - Initial PPI therapy should be once daily, 30 minutes before breakfast on an empty stomach.
| - If there is inadequate response after 4-8 weeks, step up to BID dosing for another 4-8 weeks.
| - If symptoms are controlled, it is advisable for most patients to titrate the PPI down to the lowest effective dose and attempt once yearly to taper or stop PPI use.
| - PPI deprescribing resources are available on the [Digestive Health Strategic Clinical Network website](#).
| - There are no major differences in efficacy between PPIs.
| - **Commonly prescribed agents:**
  - Rabeprazole - 10 mg
  - Pantoprazole - 40 mg
  - Dtextlansoprazole - 30 mg
  - Omeprazole - 20 mg
  - Lansoprazole - 30 mg
  - Esomeprazole - 40 mg
| - See Table 1 for PPI pricing |
| **Tricyclic antidepressants (TCAs)** |
| - **Evidence:** Shown to reduce dyspepsia symptoms in RCTs for IBS.\(^2\)
| - **Mechanism of action:** Suggested to be beyond serotonin and norepinephrine, and as a result of blocking voltage-gated ion channels, opioid receptor activation and potential neuro-immunologic anti-inflammatory effects.\(^3\)
| - **Place in therapy:** If patient has no response to PPI therapy, the Canadian Association of Gastroenterology guidelines suggest a trial of a TCA prior to a prokinetic based on superior evidence available.\(^2\)
| - **Adverse effects:** Anticholinergic and antihistaminic (drowsiness/insomnia, xerostomia, palpitations, weight gain, constipation, urinary retention).\(^3\)
| - Use with caution in patients at risk of prolonged QT.
| - It can take 2-3 months to reach maximum effect.
| - The lowest effective dose should be used.
| - Dose should be gradually reduced if discontinuing.

**Recommended Medications**
- Nortriptyline - 10-25 mg qhs. Increase dose by 10-25 mg every 3-4 weeks based on response and tolerability. May require 25-75 mg/day. Often takes 2-3 months for peak effect. ($20-60/month).
- Amitriptyline - 10-25 mg qhs. Increase dose by 10-25 mg every 3-4 weeks based on response and tolerability. May require 25-75 mg/day. Often takes 2-3 months for peak effect. ($15-20/month).
- Desipramine - 25 mg qhs. Increase based on response and tolerability (~$25/month).

---

\(^3\) Lexicomp, Inc., Lexi-Drugs Online, Hudson, Ohio: UpToDate, Inc; 2013; [cited 27 Apr 2021].
Domperidone

- **Evidence:** Prokinetic agents may reduce dyspepsia symptoms for some patients, however there is minimal evidence to support use as a first line agent.\(^2\)
- **Mechanism of action:** A prokinetic agent increases esophageal peristalsis, increases lower esophageal sphincter pressure, increases gastric motility and peristalsis, thus facilitating gastric emptying.\(^2\)
- **Place in therapy:** For patients < 60 who have failed PPI and TCA, a prokinetic agent may be offered.\(^2\)
  - Prior to initiation, ensure patient has:
    - Normal QT interval (baseline ECG recommended)
    - No family history of sudden cardiac death
    - No current medications that increase the QT interval
  - Withhold treatment if:
    - QTc is > 470 ms in males
    - QTc is > 450 ms in females
  - Starting dose is 5 mg TID AC, titrating up to 10 mg TID AC as a 2-4 week trial.

- Domperidone and/or TCA trials are appropriate within primary care, but not required prior to making a referral. If deemed clinically appropriate, these trials could occur while awaiting specialist consultation.
- There is insufficient data to recommend the routine use of bismuth, antacids, simethicone, misoprostol, anticholinergics, anti-spasmodics, SSRIs, herbal therapies, probiotics, or psychological therapies in dyspepsia. However, these therapies may benefit some patients and, thus, a trial with assessment of response may be reasonable, if clinically appropriate, and could be undertaken while awaiting specialist consultation.

8. **When to refer for consultation and/or endoscopy**
   - If alarm features are identified
   - If unsatisfactory response to management and/or pharmacological therapy
   - Provide as much information as possible on the referral form, including identified alarm feature(s), important findings, and treatment/management strategies trialed with the patient.

**Still concerned about your patient?**

The primary care physician is typically the provider who is most familiar with their patient’s overall health and knows how they tend to present. Changes in normal patterns, or onset of new or worrisome symptoms, may raise suspicion for a potentially serious diagnosis, even when investigations are normal and typical alarm features are not present. There is evidence to support the importance of the family physician’s intuition or “gut feeling” about patient symptoms, especially when the family physician is worried about a sinister cause such as cancer. A meta-analysis examining the

---

\(^4\) Maximum Allowable Cost (MAC) pricing exists for PPIs paid for by Alberta government sponsored drug programs. The drug plan will only pay the cost of rabeprazole 10 mg for lansoprazole 15 mg, omeprazole 10 mg and rabeprazole 10 mg, or the cost of pantoprazole magnesium 40 mg for all other covered PPIs. The patient will have to pay out of pocket for any difference between that price and the price of the prescribed PPI. See [link](#) for details.
predictive value of gut feelings showed that the odds of a patient being diagnosed with cancer, if a GP recorded a gut feeling, were 4.24 times higher than when no gut feeling was recorded.\(^5\)

When a “gut feeling” persists in spite of normal investigations, and you decide to refer your patient for specialist consultation, document your concerns on the referral with as much detail as possible. Another option is to seek specialist advice (see Advice Options) to convey your concerns.

**PRIMERS**

**Primer on Black Stool**

- Possible causes of black stool
  - Upper GI bleeding
  - Slow right-sided colonic bleeding
  - Epistaxis or hemoptysis with swallowed blood
- Melena is dark/black, sticky, tarry, and has a distinct odour
- Patient history should include:
  - Any prior GI bleeds or ulcer disease
  - Taking ASA, NSAIDs, anticoagulants, antiplatelets, Pepto Bismol\(^6\), SSRIs, or iron supplements
  - Significant consumption of black licorice
  - Significant alcohol history or hepatitis risk factors
  - Any other signs of bleeding (e.g. coffee ground emesis, hematemesis, hematochezia, or bright red blood per rectum)
  - Any dysphagia, abdominal pain, change in bowel movements, constitutional symptoms or signs/symptoms of significant blood loss
- Physical exam should include vitals (including postural if worried about GI bleeding) and a digital rectal exam for direct visualization of the stool to confirm, in addition to the remainder of the exam.
- Initial labs to consider include CBC, BUN (may be elevated with upper GI bleeding), INR.
- If the patient is actively bleeding, suggest calling GI on call and/or the ED for assessment, possible resuscitation, and possible endoscopic procedure.

**Iron Primer**

Evaluation of measures of iron storage can be challenging. Gastrointestinal (occult) blood loss is a common cause of iron deficiency and should be considered as a cause when iron deficiency anemia is present. Menstrual losses should also be considered.

There are two serological tests to best evaluate iron stores (ferritin, transferrin saturation) - neither of which are perfect.

The first step is to evaluate **ferritin**:

- If the ferritin is low, it is diagnostic of iron deficiency with high specificity (98% specificity).
- Ferritin is an acute phase reactant which may be elevated in the context of acute inflammation and infection. If ferritin is normal or increased, and you suspect it may be acting as an acute phase reactant, order a transferrin saturation test (see below).
  - However, if the ferritin is > 100 µg/L and there is no concurrent significant chronic renal insufficiency, iron deficiency is very unlikely - even in the context of acute inflammation/infection.

---

The second step is to evaluate **transferrin saturation**:

- The transferrin saturation is a calculated ratio using serum iron and total iron binding capacity. Serum iron alone does **not** reflect iron stores.
- Low values (< 10%) demonstrate low iron stores in conjunction with a ferritin < 100 µg/L.

In the absence of abnormal iron indices, anemia may be from other causes other than GI (occult) blood loss (e.g. bone marrow sources, thalassemia, and sickle cell anemia).

**BACKGROUND**

About this Pathway

- Digestive health primary care pathways were originally developed in 2015 as part of the Calgary Zone’s Specialist LINK initiative. They were co-developed by the Department of Gastroenterology and the Calgary Zone’s specialty integration group, which includes medical leadership and staff from Calgary and area Primary Care Networks, the Department of Family Medicine and Alberta Health Services.
- The pathways were intended to provide evidence-based guidance to support primary care providers in caring for patients with common digestive health conditions within the medical home.
- Based on the successful adoption of the primary care pathways within the Calgary Zone, and their impact on timely access to quality care, in 2017 the Digestive Health Strategic Clinical Network (DHSCN) led an initiative to validate the applicability of the pathways for Alberta and to spread availability and foster adoption of the pathways across the province.

Authors & Conflict of Interest Declaration

This pathway was reviewed and revised under the auspices of the DHSCN in 2019, by a multi-disciplinary team led by family physicians and gastroenterologists. For more information, contact the DHSCN at Digestivehealth.SCN@ahs.ca.

Pathway Review Process

Primary care pathways undergo scheduled review every three years, or earlier if there is a clinically significant change in knowledge or practice. The next scheduled review is April 2022, however we welcome feedback at any time. Please email comments to Digestivehealth.SCN@ahs.ca.

Disclaimer

This pathway represents evidence-based best practice but does not override the individual responsibility of health care professionals to make decisions appropriate to their patients using their own clinical judgment given their patients’ specific clinical conditions, in consultation with patients/alternate decision makers. The pathway is not a substitute for clinical judgment or advice of a qualified health care professional. It is expected that all users will seek advice of other appropriately qualified and regulated health care providers with any issues transcending their specific knowledge, scope of regulated practice or professional competence.
PROVIDER RESOURCES

Advice Options

Non-urgent advice is available to support family physicians.

- Gastroenterology advice is available across the province via Alberta Netcare eReferral Advice Request (responses are received within five calendar days). View the Referring Provider – FAQ document for more information.

- Non-urgent telephone advice connects family physicians and specialists in real time via a tele-advice line. Family physicians can request non-urgent advice from a gastroenterologist:
  - In the Calgary Zone at specialistlink.ca or by calling 403-910-2551. This service is available from 8:00 a.m. to 5:00 p.m. Monday to Friday (excluding statutory holidays). Calls are returned within one (1) hour.
  - In the Edmonton and North Zones by calling 1-844-633-2263 or visiting pcnconnectmd.com. This service is available from 9:00 a.m. to 6:00 p.m. Monday to Thursday and from 9:00 a.m. to 4:00 p.m. Friday (excluding statutory holidays and Christmas break). Calls are returned within two (2) business days.

| Referral to a Registered Dietitian | - Visit Alberta Referral Directory and search for nutrition counselling.  
- To learn more about programs and services offered in your zone, visit Nutrition Services.  
- Health Link has Registered Dietitians available to answer nutrition questions. If a patient has nutrition-related questions, they can call 8-1-1 and ask to talk to a Dietitian. |
1. **Check your symptoms**

- Pain or discomfort in the upper part of the stomach, often after meals
- Feeling uncomfortably full after eating
- Nausea (feeling like throwing up)
- Loss of appetite
- Bloating

2. **Make lifestyle changes to manage your symptoms** (see over for details)

- Identify foods that cause symptoms and try to limit or avoid them
- Eat smaller, more frequent meals
- Lose weight, if you need to
- Stop or reduce the use of tobacco, alcohol, and cannabis
- Avoid wearing tight clothing around your midsection

3. **Tests that may be done**

- Blood tests
- Breath or stool tests for a bacterial infection in your stomach
- Other tests are rarely needed

4. **Medicine that may be tried**

- Many options can be used to lower how much stomach acid your body makes, help digest food, or lower stomach pain
- Talk with your healthcare providers about what medicines may be right for you

**Tell your healthcare providers if you have these symptoms:**

- Stool that is black in colour or has blood in it
- Trouble swallowing or pain while swallowing food
- Feeling that food gets stuck while swallowing
- Vomiting that doesn’t stop
- Vomiting with blood in it
- Losing weight without meaning to

**What is dyspepsia?**

- A word used to describe a group of upper belly symptoms that cause pain and discomfort (sometimes called indigestion).
- Many people will have symptoms of dyspepsia at some point in their lifetime.
- Usually cared for by healthcare providers in your family doctor’s office.

**What is the dyspepsia patient pathway?**

It is a map for you and your healthcare providers to follow. It makes sure the care you are getting for dyspepsia is safe and helpful in managing your symptoms.

You and your healthcare providers may modify the pathway to best suit your healthcare needs.

If symptoms cannot be managed over time, you and your healthcare providers may decide a referral to a specialist would be helpful.
What do I need to know about my symptoms and dyspepsia?

Working through the dyspepsia patient pathway can take several months:

• Your healthcare providers will ask you questions about your health and review any medicines you are taking.
• They may suggest certain tests to learn more about possible causes of your symptoms.
• They will talk to you about possible lifestyle habits that may be causing your symptoms and how you can make changes that could help you feel better.
• You may find it helpful to write down your symptoms and what seems to cause them (e.g. certain food or stress). You and your healthcare providers can make a plan to help manage your symptoms using this information.
• Together, you may decided to try certain medicines to help in treating your symptoms.
• You may use medicines for a short amount of time (or possibly longer) depending on whether your symptoms improve.

To manage your symptoms, try to:

• Eat smaller, more frequent meals instead of 2 or 3 large meals.
• Wait 2-3 hours after you eat before you lie down.
• Change what you eat or drink. Fatty foods, spicy foods, foods with a lot of acid in them, coffee, mint, and chocolate can be causes of symptoms.
• Avoid wearing tight clothing around your midsection.
• Stop or reduce the use of alcohol, tobacco, and cannabis.
• Lose weight, if you need to. Losing just 3-5 kg (7-11 lbs) can help.

Seeing a specialist is only recommended if:

• Your symptoms continue or get worse after following treatment and management options in the dyspepsia pathway.
• You and your healthcare providers identify concerning symptoms or test results.
