Commitment to Comfort: Orientation

Ease pain and distress before, during and after immunization

Needle Fears

- Up to 25 percent of adults have needle fears.
- About 10 percent of those adults have such significant needle fear that they will avoid immunization and other healthcare procedures. 1,2,3
- Healthcare providers play a critical role in implementing strategies that optimize immunization uptake, ease fears and promote comfort.

AHS' Commitment to Comfort

- Commitment to Comfort (CTC) is an evidence-based quality improvement initiative that was developed at the Alberta Children's Hospital in 2014.
- The five CTC principles promote comfort by helping lessen pain and distress during healthcare interactions. 4,5,6
- These evidence-informed principles and strategies have been expanded to support adult COVID-19 immunization in Alberta.
- AHS has integrated CTC into the <u>COVID-19 Immunization Policy</u> to be used in collaboration with clients and families.
- Application of the five CTC principles reduces fear and pain to improve immunization readiness, experience and uptake.

Five CTC Principles

1. Make a Comfort Plan

- Consider what can be done before, during and after immunization.
- Ask the client how they are feeling about getting a needle.
- Offer CTC choices to identify preferred comfort strategies.

Use Positive Language

- Language is an impactful intervention to reduce pain and distress.
- See Positive Language Guide for Immunizers

3. Position Comfortably

- If possible, have the client sit in an upright comfortable position, with their arm relaxed.
- If the client feels faint, or has a history of fainting with needles:
 - Encourage alternating muscle tension and relaxation (for 15 seconds each). If possible, have them sit or lie down.
 - o Call for support if needed.

4. Use Distraction

- Shift the client's attention away from the needle by suggesting slow deep breathing, having them think of a favorite place, using their phone or tablet (for a game or music) or engaging in small talk about the weather or another neutral subject.
- See the Distraction Techniques Guide

5. Use Numbing Cream

- If the client chooses to use numbing cream, it must be obtained and applied by the client prior to their appointment.
- Numbing cream will not be available or offered at AHS immunization sites.
- Before their immunization appointment, clients can talk with a pharmacist to select and obtain a product that is right for them.
- Brand names include: Ametop, Emla and Maxilene
- See Numbing Cream Guide
