**Care After Immunization**

**Common side effects**

Many people have no side effects from the Imvamune vaccine. If you do have side effects, they tend to be mild to moderate and go away within 7 days. Common side effects may include:

- at the area where you had the needle: redness, changes in skin colour, bruising, swelling, warmth, itching, a hard spot or a small lump, or feeling sore
- feeling tired
- a headache
- a fever or chills
- body aches, sore joints
- pain in your arms or legs
- not feeling hungry or not wanting to eat (poor appetite)
- feeling sick to your stomach (nausea)

Call Health Link at 811 to report any serious or unusual side effects. It is rare to have a serious side effect.

**Rare events after getting Imvamune**

There have been reports of cardiac (heart) symptoms after getting Imvamune. However, none were considered serious. There have also been reports of myopericarditis (an inflammation of both the heart muscle and the lining around the heart) after other vaccines that protect against smallpox. However, no cases of myopericarditis after Imvamune have been reported. Get medical help right away if you have any of these symptoms:

- shortness of breath
- chest pain
- a fluttering feeling in your chest (palpitations)

**If you have side effects that are the same as COVID-19 symptoms**

If you have side effects that are the same as COVID-19 symptoms, you may be recommended to stay home and away from others (isolate). Go to myhealth.alberta.ca/Immunization-and-COVID19-FAQ for more information.

If you only have side effects where you had the needle (local reaction), you do not need to stay home and away from others.

For more information about the Imvamune, read the Imvamune vaccine information sheet on www.ImmunizeAlberta.ca or talk to your healthcare provider.

Side A
What can I do to feel better?

- To help with soreness and swelling:
  - Put a cool, wet cloth over the area where you had the needle.
  - Move the arm or leg where you had the needle.
- If you have a fever, wear fewer layers of clothes and drink more fluids. For more information about fever, go to MyHealth.Alberta.ca.
- There is medicine to help with a fever or pain. Check with your doctor or pharmacist if you are not sure what medicine or dose to take. Follow the directions on the package.
- Children under the age 18 years should not take aspirin (unless your doctor has told you to take it) because it can cause serious health problems if taken within 6 weeks of a vaccine.
- Some people with health problems, such as a weak immune system, must call their doctor if they get a fever. If you were told to do this, call your doctor even if you think the fever is from the vaccine.
