

## Changing from Cellcept® oral suspension to Mar-Mycophenolate Mofetil oral suspension

Alberta Health has made changes to mycophenolate mofetil oral suspension drug benefit coverage for people who have had a transplant. Cellcept® oral suspension is being replaced with the generic equivalent, **Mar-Mycophenolate Mofetil oral suspension**, which Health Canada says is as effective and safe as Cellcept® oral suspension.

Important points:

- Please use up your supply of **Cellcept® oral suspension** before you start taking Mar-Mycophenolate Mofetil oral suspension. **Don't take both Cellcept® oral suspension and Mar-Mycophenolate Mofetil oral suspension at the same time.**
- Notify your transplant coordinator when you switch from taking Cellcept® oral suspension to Mar-Mycophenolate suspension as normal transplant bloodwork may be required.

Your new Mar-mycophenolate mofetil oral suspension replaces the Cellcept® oral suspension.

- Cellcept® oral suspension and Mar-Mycophenolic mofetil oral suspension are similar in how they look and taste (both suspensions have a white colour and fruit flavour)

For any questions about changing from **Cellcept® oral suspension** to **Mar-Mycophenolate Mofetil oral suspension**, please contact your Transplant Team or Rexall Pharmacy.
