

Drug Screen Instructions to the Donor

1. You must provide a minimum sample of at least:
 - 45 mL (split samples)
 - 30 mL (single sample)
2. DO NOT flush the toilet.
3. You have washed your hands as part of the collection procedure, and will not be allowed to wash your hands again until the sample has been sealed by the tamper evident seal(s).
4. If you cannot provide an adequate sample with one void within 5 minutes, come out of the washroom and tell the collector that you cannot provide a sample.
5. Come out of the washroom immediately after collecting the sample and return the sample to the collector as soon as possible.
6. The temperature of the sample is a critical factor.
If it takes longer than 4 minutes from the time the donor urinates in the container to the time the collector takes the specimen temperature, the potential exists that the specimen may be out of temperature range. In this case, another sample or a same-gender observed-collection may be required.
